Recommendation letter for Noé Boulud

To whom it may concern.

It is my pleasure to support the application of Noé Boulud.

I had the opportunity to work closely with Noé Boulud during his research project at EPFL, where I supervised his work on the analysis of brain activity using fMRI data.

Noé has a strong background in computer science, which was clearly reflected in the way he approached this project. Throughout the project, he demonstrated his ability to handle complex datasets, build robust analysis pipelines, and translate technical challenges into clear and actionable steps.

What distinguishes Noé is his approach to problem-solving. When faced with complex questions, he takes a step back, structures the problem, and identifies the key elements needed to move forward. This allows him to remain efficient while maintaining clarity, even in situations with a high level of complexity or ambiguity.

He was very receptive to feedback: our regular discussions allowed him to continuously refine his approach, and he was able to quickly integrate suggestions and adjust his work accordingly. This ability to iterate and improve based on feedback made the collaboration particularly effective.

Noé was also proactive throughout the project. He did not limit himself to executing tasks, but regularly made relevant suggestions and proposed concrete improvements to the analysis. In addition to his existing technical skills, he showed a strong capacity to quickly develop new competencies when needed, allowing him to meet the evolving requirements of the project.

Noé communicates in a clear and structured way. He is able to present complex ideas in a concise and accessible manner, both in informal discussions and formal presentations.

From a team perspective, Noé is reliable, professional, and easy to work with.

Overall, Noé combines strong analytical skills with scientific rigour, intellectual curiosity, and the ability to quickly engage with complex research questions. I am confident that he will perform very well in demanding research environments, and I strongly recommend him.

Sincerely,

Timothée Proix
